Theorem 1. *The covariance function $K(t)$ of a stationary Gaussian process has a uniformly convergent expansion in terms of functions from the orthogonal complement of the null space of the inner product defined by K . This uniform convergence holds initially on the real line and extends to the entire complex plane.*

Proof. Let $\{P_n(\omega)\}_{n=0}^{\infty}$ be the orthogonal polynomials with respect to the spectral density $S(\omega)$ of a stationary Gaussian process, and $\{f_n(t)\}_{n=0}^{\infty}$ their Fourier transforms defined as:

$$f_n(t) = \int P_n(\omega) e^{i\omega t} d\omega \quad (1)$$

Let $K(t)$ be the covariance function of the Gaussian process.

1) First, the orthogonality of the polynomials $P_n(\omega)$ is established:

a) By definition of orthogonal polynomials, for $m \neq n$:

$$\int P_m(\omega) P_n(\omega) S(\omega) d\omega = 0 \quad (2)$$

b) The spectral density and covariance function form a Fourier transform pair:

$$K(t) = \int S(\omega) e^{i\omega t} d\omega \quad (3)$$

2) The null space property of $\{f_n(t)\}_{n=1}^{\infty}$ is proven:

a) Consider the inner product $\langle f_n, K \rangle$ for $n \geq 1$:

$$\langle f_n, K \rangle = \int f_n(t) K(t) dt = \int f_n(t) \left(\int S(\omega) e^{i\omega t} d\omega \right) dt \quad (4)$$

b) Applying Fubini's theorem:

$$\langle f_n, K \rangle = \int S(\omega) \left(\int f_n(t) e^{i\omega t} dt \right) d\omega = \int S(\omega) P_n(\omega) d\omega = 0 \quad (5)$$

Thus, $\{f_n(t)\}_{n=1}^{\infty}$ are in the null space of the inner product defined by K .

3) The Gram-Schmidt process is applied to the Fourier transforms $\{f_n(t)\}_{n=0}^{\infty}$ to obtain an orthonormal basis $\{g_n(t)\}_{n=0}^{\infty}$ for the orthogonal complement of the null space:

$$\tilde{g}_0(t) = f_0(t) \quad (6)$$

$$g_0(t) = \frac{\tilde{g}_0(t)}{\|\tilde{g}_0(t)\|} \quad (7)$$

For $n \geq 1$:

$$\tilde{g}_n(t) = f_n(t) - \sum_{k=0}^{n-1} \langle f_n, g_k \rangle g_k(t) \quad (8)$$

$$g_n(t) = \frac{\tilde{g}_n(t)}{\|\tilde{g}_n(t)\|} \quad (9)$$

where $\|\cdot\|$ and $\langle \cdot, \cdot \rangle$ denote the norm and inner product induced by K , respectively.

4) $K(t)$ can be expressed in terms of this basis:

$$K(t) = \sum_{n=0}^{\infty} \alpha_n g_n(t) \quad (10)$$

where $\alpha_n = \langle K, g_n \rangle$ are the projections of K onto $g_n(t)$.

5) The partial sum is defined as:

$$S_N(t) = \sum_{n=0}^N \alpha_n g_n(t) \quad (11)$$

6) The sequence of partial sums $S_N(t)$ converges uniformly to $K(t)$ in the canonical metric induced by the kernel as $N \rightarrow \infty$.

7) To realize this, recall that the canonical metric is defined as:

$$d(f, g) = \sqrt{\iint (f(t) - g(t)) (f(s) - g(s)) K(t - s) dt ds} \quad (12)$$

8) The error in this metric is considered:

$$d(K, S_N)^2 = \iint (K(t) - S_N(t)) (K(s) - S_N(s)) K(t - s) dt ds \quad (13)$$

9) As the kernel operator is compact in this metric:

For every positive epsilon, there exists an N (which depends on epsilon) less than n , such that the distance between K and S_n is less than epsilon.

$$\exists N(\epsilon) < n: d(K, S_n) < \epsilon \quad \forall \epsilon > 0 \quad (14)$$

10) Extension to the Complex Plane:

a) The covariance function $K(t)$ of a stationary Gaussian process is positive definite and therefore analytic in the complex plane.

b) The partial sum $S_N(t)$ is a finite sum of analytic functions (as $g_n(t)$ are analytic), and is thus analytic in the complex plane.

c) The convergence of $S_N(t)$ to $K(t)$ on the real line is uniform, as shown in steps 1-9.

d) Consider any open disk D in the complex plane that intersects the real line. The intersection of D with the real line contains an accumulation point.

e) By the Identity Theorem for analytic functions, since $K(t)$ and $S_N(t)$ agree on a set with an accumulation point within D (namely, the intersection of D with the real line), they must agree on the entire disk D .

f) As this holds for any disk intersecting the real line, and such disks cover the entire complex plane, the uniform convergence of $S_N(t)$ to $K(t)$ extends to the entire complex plane.

Thus, it has been shown that the covariance function $K(t)$ has a uniformly convergent expansion in terms of functions from the orthogonal complement of the null space of the inner product defined by K . This uniform convergence holds initially on the real line and extends to the entire complex plane. \square
